ABSTRACT

Cross-Platform Match/Session App for Sports & Athletics

Players and athletes often struggle to organize matches, track sessions, and stay updated in real time.

- Connect athletes and sports participants through a single platform.
- Help users find suitable matches and sessions.
- Simplify scheduling and participation.
- Provide a convenient platform accessible across different devices.
- Improve coordination between players, coaches, and organizers.

PROBLEM STATEMENT

Sports activities require proper coordination between players, coaches, and organizers, but current methods are scattered and inefficient. Athletes face difficulty in finding suitable participants, managing schedules, and tracking availability. Manual coordination often leads to missed updates, cancellations, and poor communication. Existing solutions lack a centralized platform that integrates matchmaking, session management, and notifications. This results in limited performance insights and challenges in overall activity management. A unified cross-platform app is needed to streamline coordination and improve efficiency.

Frameworks

- Flutter (Dart)
- Node.js API
- MySQL
- Firebase Cloud Messaging (FCM)

Proposed Outcomes

The proposed application aims to provide:

- A centralized platform for sports activities.
- Efficient player matchmaking.
- Easy creation and management of sessions.
- Better coordination between participants.
- Improved scheduling and availability management.
- Simplified participant management.
- Secure user authentication.

THANK
YOU
